- Purpose of economy is to increase human wealth;
- Earth and its natural wealth is basically infinite.

Smith (1776)

Published in 1776

Role of Mainstream “Official” Economic Model

For almost a century, the **consumption of products has been the dominant paradigm and mindset.**

John Maynard Keynes (*“The General Theory of Employment, Interest and Money”*, 1936):
“I should support at the same time all sorts of policies for increasing the propensity to consume. For it is unlikely that full employment can be maintained, whatever we may do about investment, with the existing propensity to consume.”

Victor Lebow (1955): *“Our enormously productive economy ... demands that we make consumption our way of life, that we convert the buying and use of goods into rituals, that we **seek our spiritual satisfaction, our ego satisfaction, in consumption ... we need things consumed, burned up, replaced and discarded at an ever-accelerating rate.**”*

Role of Mainstream “Official” Economic Model

For almost a century, the **consumption of products has been the dominant paradigm and mindset.**

John Maynard Keynes (*“The General Theory of Employment, Interest and Money”*, 1936):
“I should support at the same time all sorts of policies for increasing the propensity to consume. For it is unlikely that full employment can be maintained, whatever we may do about investment, with the existing propensity to consume.”

Victor Lebow (1955): *“Our enormously productive economy ... demands that we make consumption our way of life, that we convert the buying and use of goods into rituals, that we **seek our spiritual satisfaction, our ego satisfaction, in consumption ... we need things consumed, burned up, replaced and discarded at an ever-accelerating rate.**”*

In 1970, Milton Friedman argued that businesses’ sole purpose is to generate profit for shareholders.

This led to globalization ...

Moral consequences of economic growth:

“Benjamin M. Friedman ’66, Jf ’71, Ph.D. ’71, Maier professor of political economy, now fills in this gap:

he makes a powerful argument that—politically and sociologically—modern society is a bicycle, with **economic growth** being the forward momentum that **keeps the wheels spinning**.

As long as the wheels of a bicycle are spinning rapidly, it is a very stable vehicle indeed.

But, he argues, **when the wheels stop**—even as the result of economic *stagnation*, rather than a downturn or a depression—**political democracy, individual liberty, and social tolerance are then greatly at risk** even in countries where the absolute level of material prosperity remains high.”

DeLong (2006)

Purpose of Economy

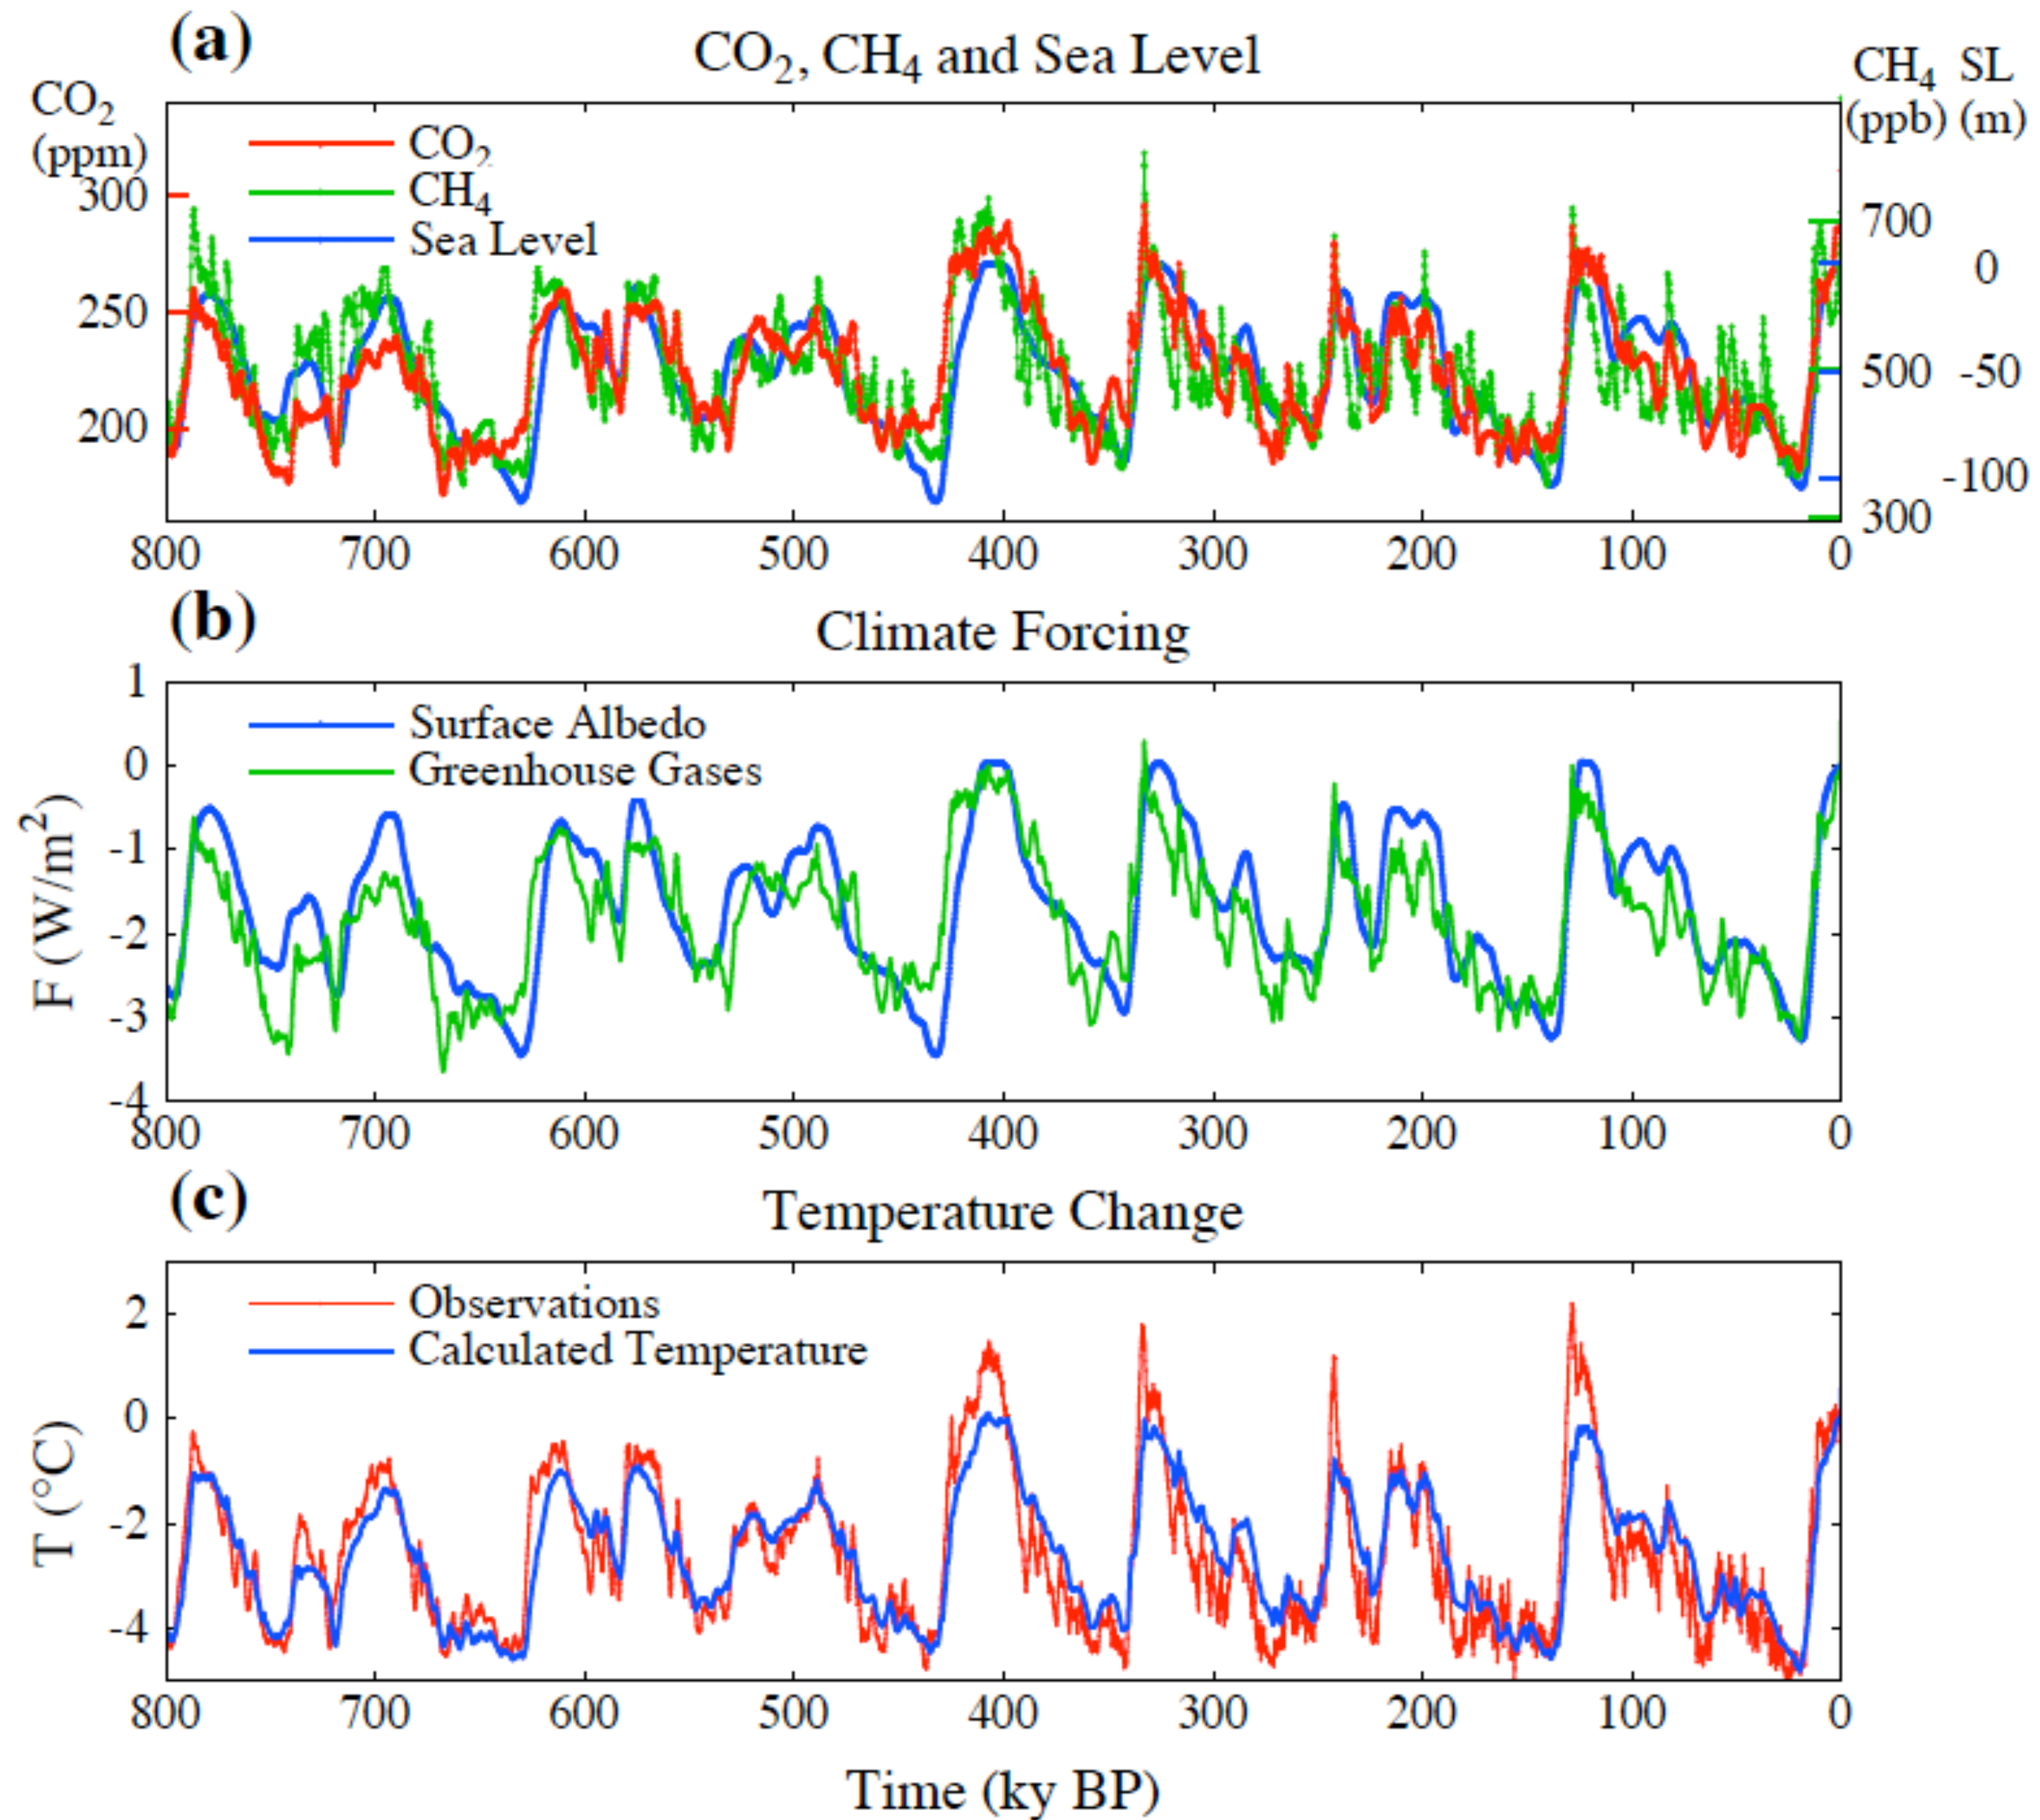

The *de facto* purpose of economy is to meet the needs of the present while safeguarding the Earth's life-support system, on which the welfare of all current and future generation depends.

The current "official" purpose of economy is to create human wealth, and this official purpose is in conflict with the *de facto* purpose.

Our economy depends on increasing flows:

Syndrome of Modern Global Change

Our economy depends on increasing flows:

In 2008, people around the world used 68 billion tons of materials, including metals and minerals, fossil fuels, and biomass. That is an average of 10 tons per person— or 27 kilograms each and every day. That same year, humanity used the biocapacity of 1.5 planets, consuming far beyond what the Earth can sustainably provide.

Assadourian, 2013

Rivers as a source for marine litter

What we Know: Plastic is found everywhere

The pathway by which plastic enters the world's oceans

Our World
in Data

Estimates of global plastics entering the oceans from land-based sources in 2010 based on the pathway from primary production through to marine plastic inputs.

**Global primary plastic production:
270 million tonnes per year**

**Global plastic waste:
275 million tonnes per year**

It can exceed primary production in a given year since it can incorporate production from previous years.

**Coastal plastic waste:
99.5 million tonnes per**

This is the total of plastic waste generated by all populations within 50 kilometres of a coastline (therefore at risk of entering the ocean).

**Mismanaged coastal plastic waste:
31.9 million tonnes per year**

This is the annual sum of inadequately managed and littered plastic waste from coastal populations. Inadequately managed waste is that which is stored in open or insecure landfills (and therefore at risk of leakage or loss).

**Plastic inputs to the oceans:
8 million tonnes per year**

**Plastic in surface waters:
10,000s to 100,000s tonnes**

There is a wide range of estimates of the quantity of plastics in surface waters. It remains unclear where the majority of plastic inputs end up — a large quantity might accumulate at greater depths or on the seafloor.

Open-File Report 2019-1048

It is Raining Plastic.

By Gregory Wetherbee,¹ Austin Baldwin,² James Ranville³

¹USGS, Hydrologic Networks Branch, Denver, Colorado; ²USGS, Water Science Center, Boise, Idaho; ³Colorado School of Mines, Golden, Colorado

Overview

Atmospheric wet deposition samples were collected using the National Atmospheric Deposition Program/National Trends Network (NADP/NTN) at eight sites (see map) in the Colorado Front Range. Plastics were identified in more than 90 percent of the samples. The plastic materials were mostly fibers that were only visible with magnification, approximately 20–40 times (X). Fibers were present in a variety of colors; the most frequently observed color was blue followed by red>silver>purple>green>yellow>other colors. Plastic particles such as beads and shards were also observed with magnification. More plastic fibers were observed in samples from urban sites than from remote, mountainous sites. However, frequent observation of plastic fibers in washout samples from the remote site CO98 at Loch Vale in Rocky Mountain National Park (elevation 3,159 meters) suggests that wet deposition of plastic is ubiquitous and not just an urban condition.

Sampling Network

The Network for Urban Atmospheric Nitrogen Chemistry (NUANC) is an NTN subnetwork of five sites in the Denver and Boulder, Colorado urban corridor. An additional urban site (CO84) is located outside Boulder, Colorado. Rural and remote montane NTN sites are nearby and form a southeast-trending transect of NTN sites with the NUANC.

Methods

NUANC samples were collected in plastic bag-lined buckets. Sites CO84, CO94, and CO98 used standard, unlined NTN buckets. The entire volumes of each sample submitted to the NADP Central Analytical Laboratory were filtered (0.45 micrometer, polyethersulfone) to obtain particulates assumed to be washed from the atmosphere (washout). The filters were dried, weighed, and manually analyzed with a binocular microscope fitted with a digital camera (see photomicrographs). Four deionized water rinses of the sampling system were analyzed as blanks. This study was not designed for collecting and analyzing samples for plastic particles. The results are unanticipated and opportune.

Results

General types of particles were classified in the observations (see table). Air mass back-trajectory analysis for site CO98 samples was completed using the HYSPLIT model for 24 hours prior to each sample collection at 500-, 750-, and 1,000-meter altitudes. (National Oceanic and Atmospheric Administration,

Photomicrographs of plastics collected at the NUANC NTN subnetwork, Sugarloaf, and Loch Vale sites in Colorado

CO98	8/29/2017	516.4	3.3	Yes	Yes	Yes	Yes	Yes	Yes	Plastic fiber	266		

<https://ready.arl.noaa.gov/HYSPLIT.php>) Urban areas are southeast (approximately 140°) of site CO98, but plastic deposition was more positively identified for westerly storms than easterly storms. In the four blank samples, there was one small translucent fiber observed that might have been plastic. Translucent and white materials, which are the colors of the sampling apparatus, were disregarded in the analyses.

Discussion

The mass of plastic in even the most concentrated samples was not large enough to weigh or reliably estimate. Developing a routine capability to calculate plastic wet-deposition loads is not possible with current (2019) technology. Methods for more accurate estimation of plastic loads are needed.

Better quality control to limit cross contamination and methods for estimation of percent recovery of the plastic materials from NADP samples are needed. Retaining NADP filters for subsequent analysis would make a washout deposition network possible with very little added expense.

How these plastic materials are accumulating and being assimilated in the environment and biota is unclear. Moreover, the potential effects of these materials on biota is not understood.

Conclusions

It is raining plastic. Better methods for sampling, identification, and quantification of plastic deposition along with assessment of potential ecological effects are needed.

What we Know: Plastic is not handled well

Plastic waste generation per person, 2010

Our World
in Data

Daily plastic waste generation per person, measured in kilograms per person per day. This measures the overall per capita plastic waste generation rate prior to waste management, recycling or incineration. It does not therefore directly indicate the risk of pollution to waterways or marine environments.

“Solutions” that create new problems:

- In 1993, Patagonia became the first outdoor gear company to use recycled PET bottles to make some of its fleece garments.
- This environmentally conscious firm proudly states that this was “a positive step towards a more sustainable system—one that uses fewer resources, discards less and better protects people’s health.”
- Since then, some 92 million PET bottles have been transformed into articles of clothing.
- However, for many firms that produce fleece pullovers and jackets, recent discoveries about microfibers in wastewater present a challenge to take a further innovative step to protect the environment.

Brain damage in fish affected by plastic nanoparticles

by Lund University

A school of sardines in Italy. Credit: Wikimedia / Alessandro Duci

Calculations have shown that 10 per cent of all plastic produced around the world ultimately ends up in the oceans. As a result, a large majority of global marine debris is in fact plastic waste. Human production of plastics is a well-known environmental concern, but few studies have studied the effects of tiny plastic particles, known as nanoplastic particles.

Abstract

The tremendous increases in production of plastic materials has led to an accumulation of plastic pollution worldwide. Many studies have addressed the physical effects of large-sized plastics on organisms, whereas few have focused on plastic nanoparticles, despite their distinct chemical, physical and mechanical properties. Hence our

Key Points

Purpose of Economy

The *de facto* purpose of economy is to meet the needs of the present while safeguarding the Earth's life-support system, on which the welfare of all current and future generation depends.

The current “official” purpose of economy is to create human wealth, and this official purpose is in conflict with the *de facto* purpose.

Syndrome of Modern Global Change

The Holocene was a “safe operating space for humanity” allowing the emergence of a dominant species

During the last few hundred years, humanity has made large and rapid planetary changes, accelerated existing and introduced new flows in the planetary physiology.

The system is outside the “normal range” and in the dynamic transition into the Post-Holocene.

Can the Economy in Modern Society Work Without Polluting the Environment with Our Growing Waste?

Metabolic Rate

Scaling law for metabolic rate:

$$Y = Y_0 * M^{(3/4)}$$

human: $Y = 50 - 100$ Watt

Extended metabolic rate:

$$Y_E = Y + C_E$$

(C_E : total energy consumption)

Energy consumption per capita:

Global Average: $Y_E = 2,835$ Watt

$M = 10$ metric tons

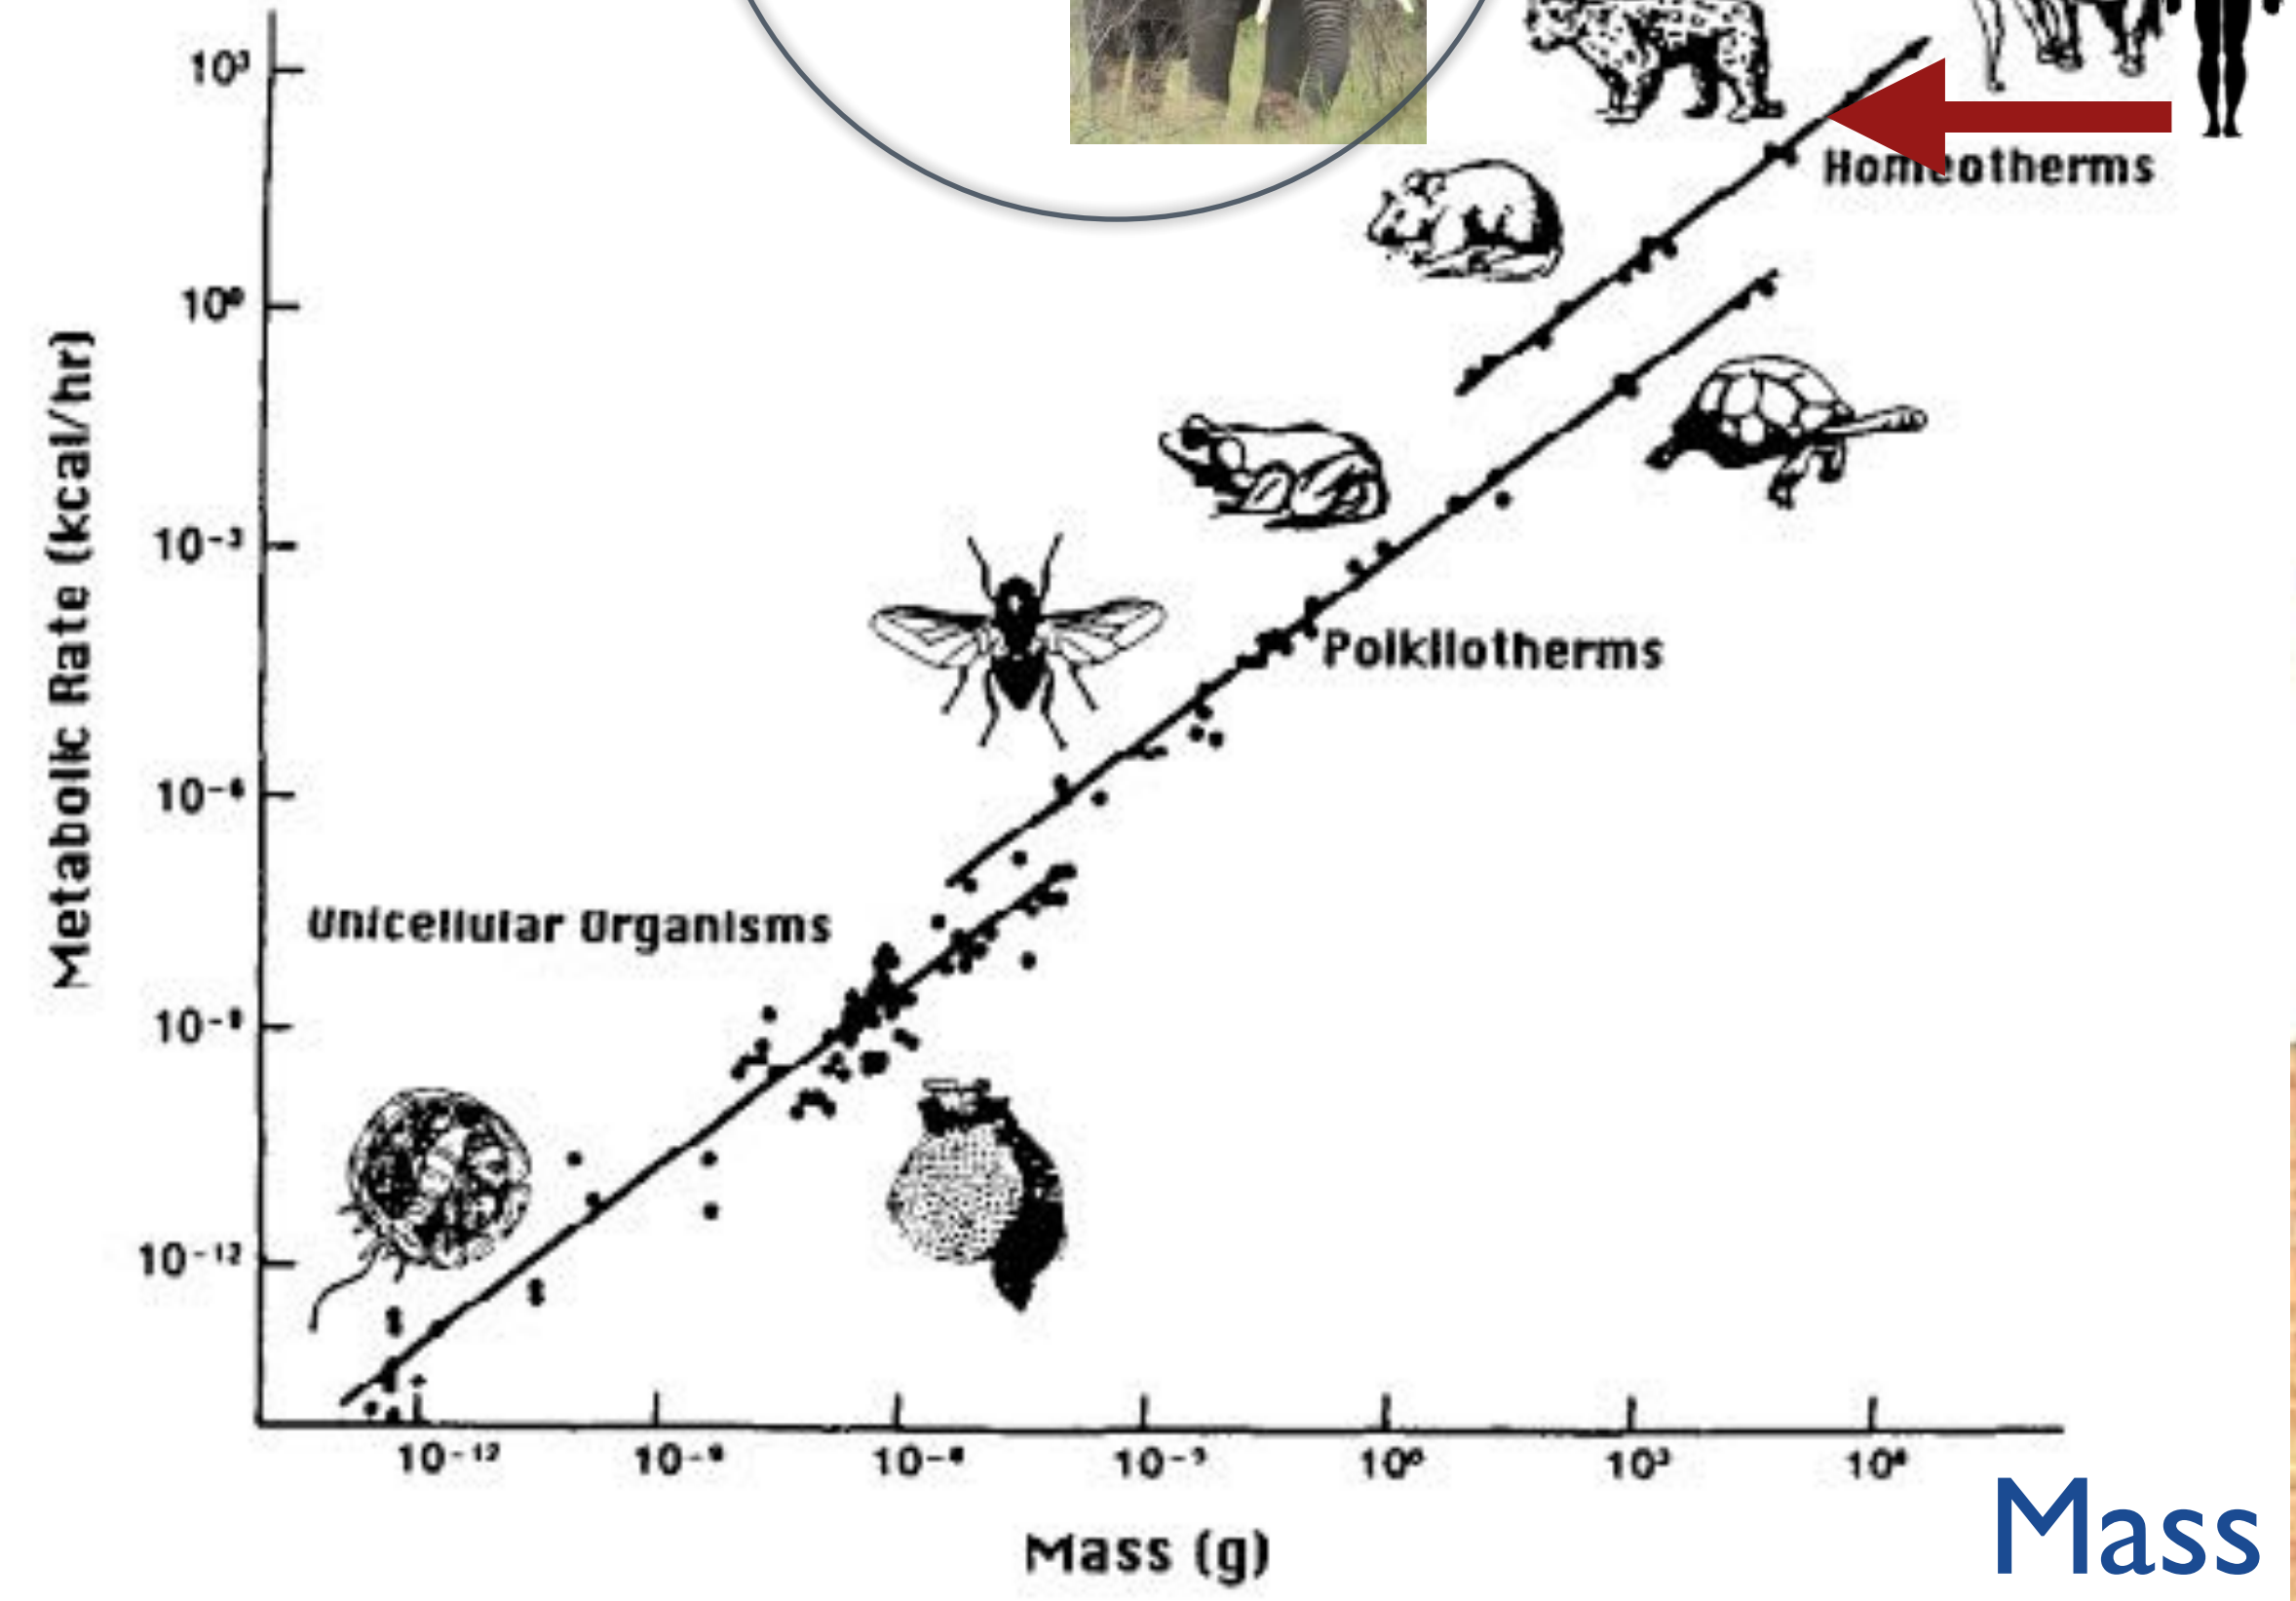

Humanity has an extended metabolic rate equivalent to 14 Billion elephants (2.7 Billion for the U.S. alone)

The Diagnosis: Creating Human Wealth Without Regard for Natural Wealth

Out of Scale

Our Mainstream Economic Model

Published in 1776

The current mainstream model of the global **economy** is based on a number of assumptions about the way the world works, what the economy is, and what the economy is for. These assumptions arose in an earlier period, when the world was relatively empty of humans and their artifacts. Built capital was the limiting factor, while natural capital was abundant. It made sense not to worry too much about environmental “externalities,” since they could be assumed to be relatively small and ultimately solvable. It also made sense to focus on the growth of the market economy, as measured by gross domestic product (GDP), as a primary means to improve human welfare. And it made sense to think of the economy as only marketed goods and services and to think of the goal as increasing the amount of these that were produced and consumed.

The Worldwatch Institute. State of the World 2013: Is Sustainability Still Possible? (Kindle Locations 2921-2927). Island Press. Kindle Edition.

The vast majority of the world's richest 10% high emitters still live in rich OECD countries, although that is slowly changing.

Key Points

Purpose of Economy

The *de facto* purpose of economy is to meet the needs of the present while safeguarding the Earth's life-support system, on which the welfare of all current and future generation depends.

The current “official” purpose of economy is to create human wealth, and this official purpose is in conflict with the *de facto* purpose.

Syndrome of Modern Global Change

The Holocene was a “safe operating space for humanity” allowing the emergence of a dominant species

During the last few hundred years, humanity has made large and rapid planetary changes, accelerated existing and introduced new flows in the planetary physiology.

The system is outside the “normal range” and in the dynamic transition into the Post-Holocene.

Diagnosis

Making the creation of human wealth the “official” purpose of economy and economic growth the overarching goal turned humans into the “Anthropogenic Cataclysmic Virus” (ACV) in the Earth's life-support system.

Easy access to seemingly unlimited energy allowed humans to accelerate flows in the Earth's life-support system and sustain rapid population growth and increasing demands.

Article Figures & SI Info & Metrics PDF

Significance

We show that for thousands of years, humans have concentrated in a surprisingly narrow subset of Earth's available climates, characterized by mean annual temperatures around $-13\text{ }^{\circ}\text{C}$. This distribution likely reflects a human temperature niche related to fundamental constraints. We demonstrate that depending on scenarios of population growth and warming, over the coming 50 y, 1 to 3 billion people are projected to be left outside the climate conditions that have served humanity well over the past 6,000 y. Absent climate mitigation or migration, a substantial part of humanity will be exposed to mean annual temperatures warmer than nearly anywhere today.

We demonstrate that depending on scenarios of population growth and warming, over the coming 50 y, **1 to 3 billion people** are projected to be **left outside** the climate conditions that have served humanity well over the last 6,000 y.

Intercontinental network for the promotion
of social solidarity economy

Who we are **What is SSE** WSFTE 2020 Continental networks Working Are

What is Social Solidarity Economy

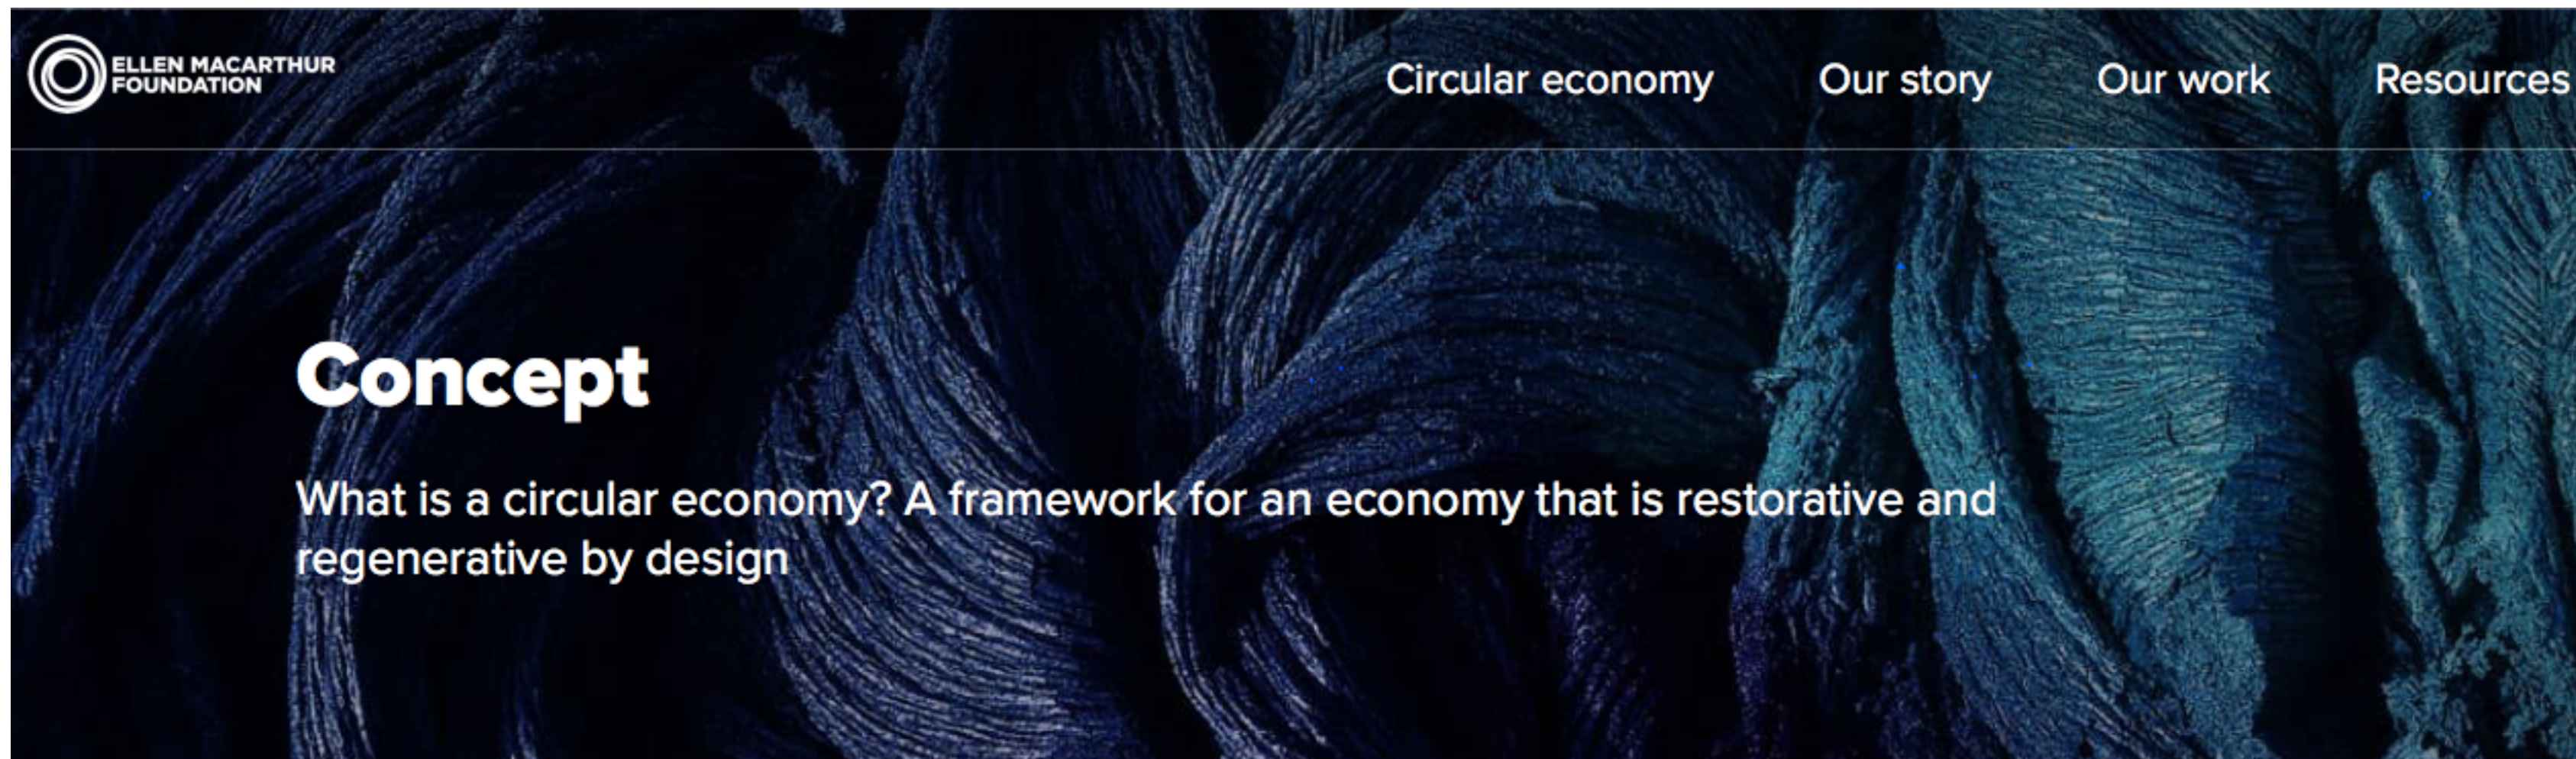

WHY SOLIDARITY-BASED ECONOMIC PRACTICES

“ Today, perhaps as never before, more people are becoming aware that capitalism has turned our lives and our planet into a commodity. A system that is environmentally unsustainable and socially unjust, and that it is not able to guarantee the happiness and dignified life conditions of all persons in any place on the planet. **Carlos Askunze, REAS Spanish network of solidarity economy.**

WHAT IS SOCIAL SOLIDARITY ECONOMY

“ *The Social Solidarity Economy is an alternative to capitalism and other authoritarian, state-dominated economic systems. In SSE ordinary people play an active role in shaping all of the dimensions of human life: economic, social, cultural, political, and environmental. SSE exists in all sectors of the economy production, finance, distribution, exchange, consumption and governance. It also aims to transform the social and economic system that includes public, private and third sectors. SSE is not only about the poor, but strives to overcome inequalities, which includes all classes of society. SSE has the ability to take the best practices that exist in our present system (such as efficiency, use of technology and knowledge) and transform them to serve the welfare of the community based on different values and goals.*

(...) SSE seeks systemic transformation that goes beyond superficial change in which the root oppressive structures and fundamental issues remain intact.

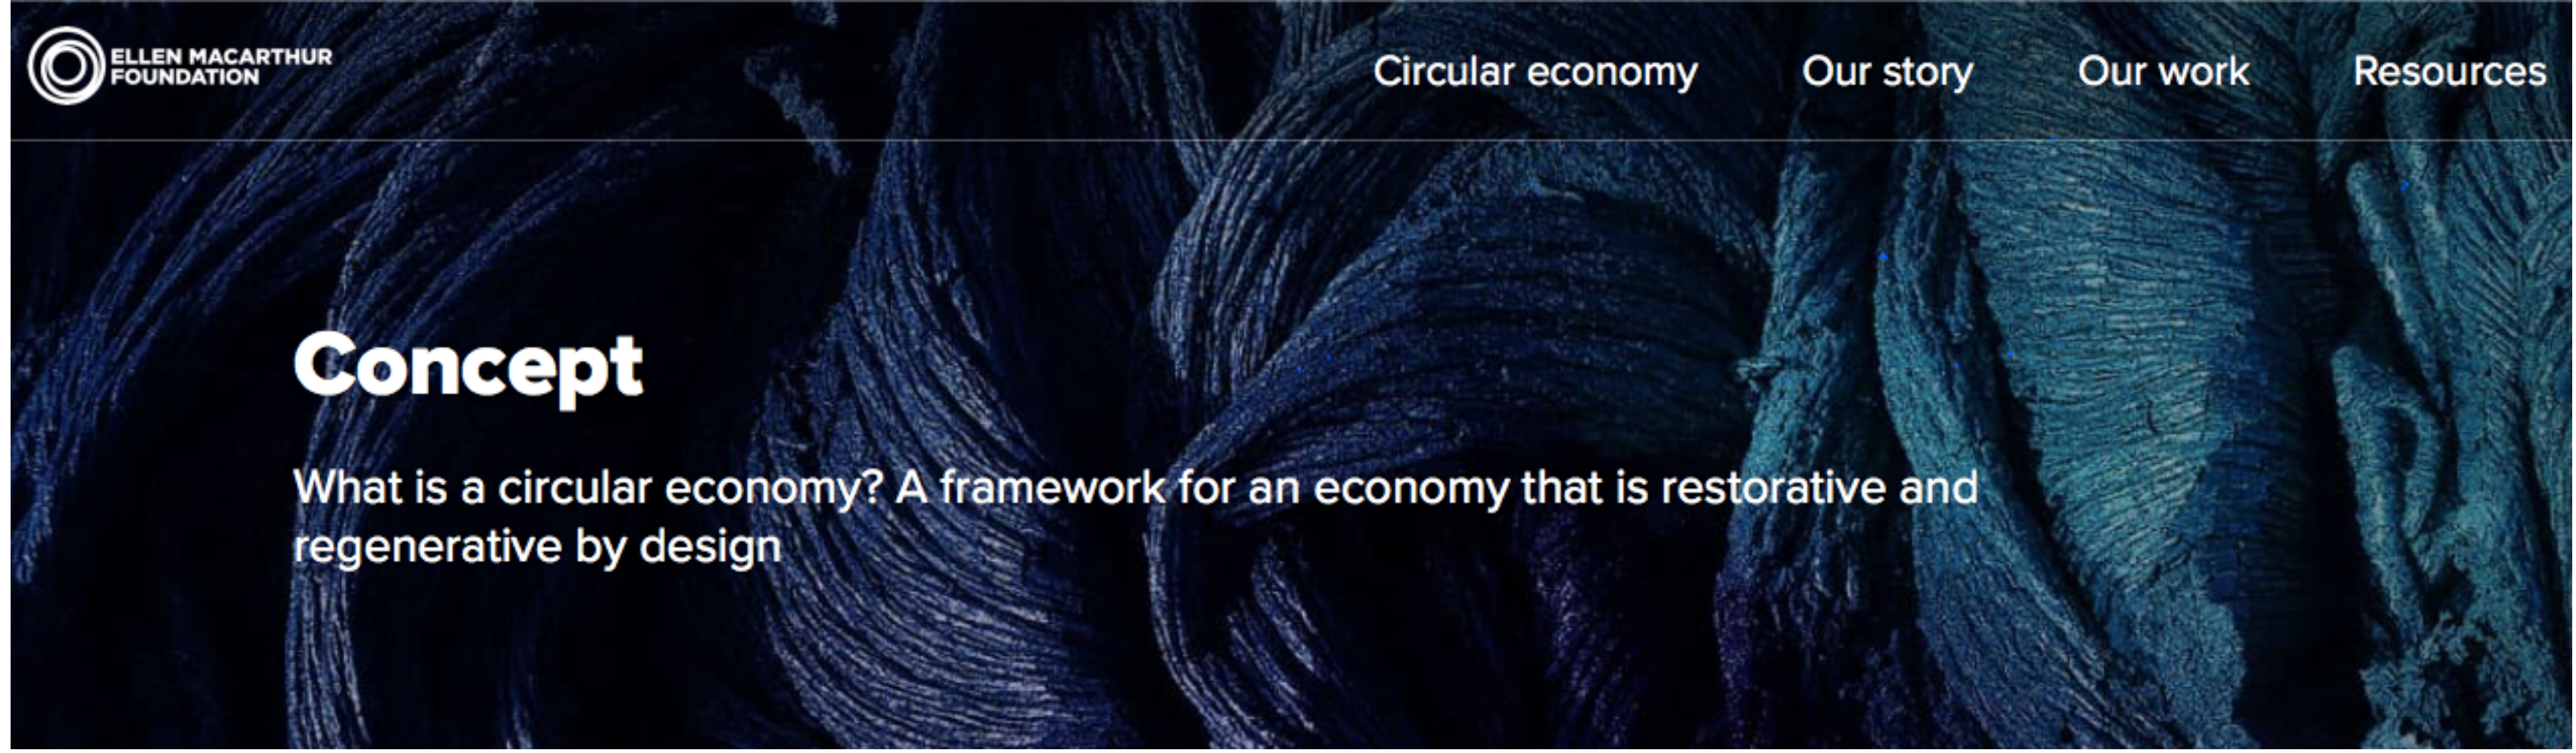

What is a circular economy?

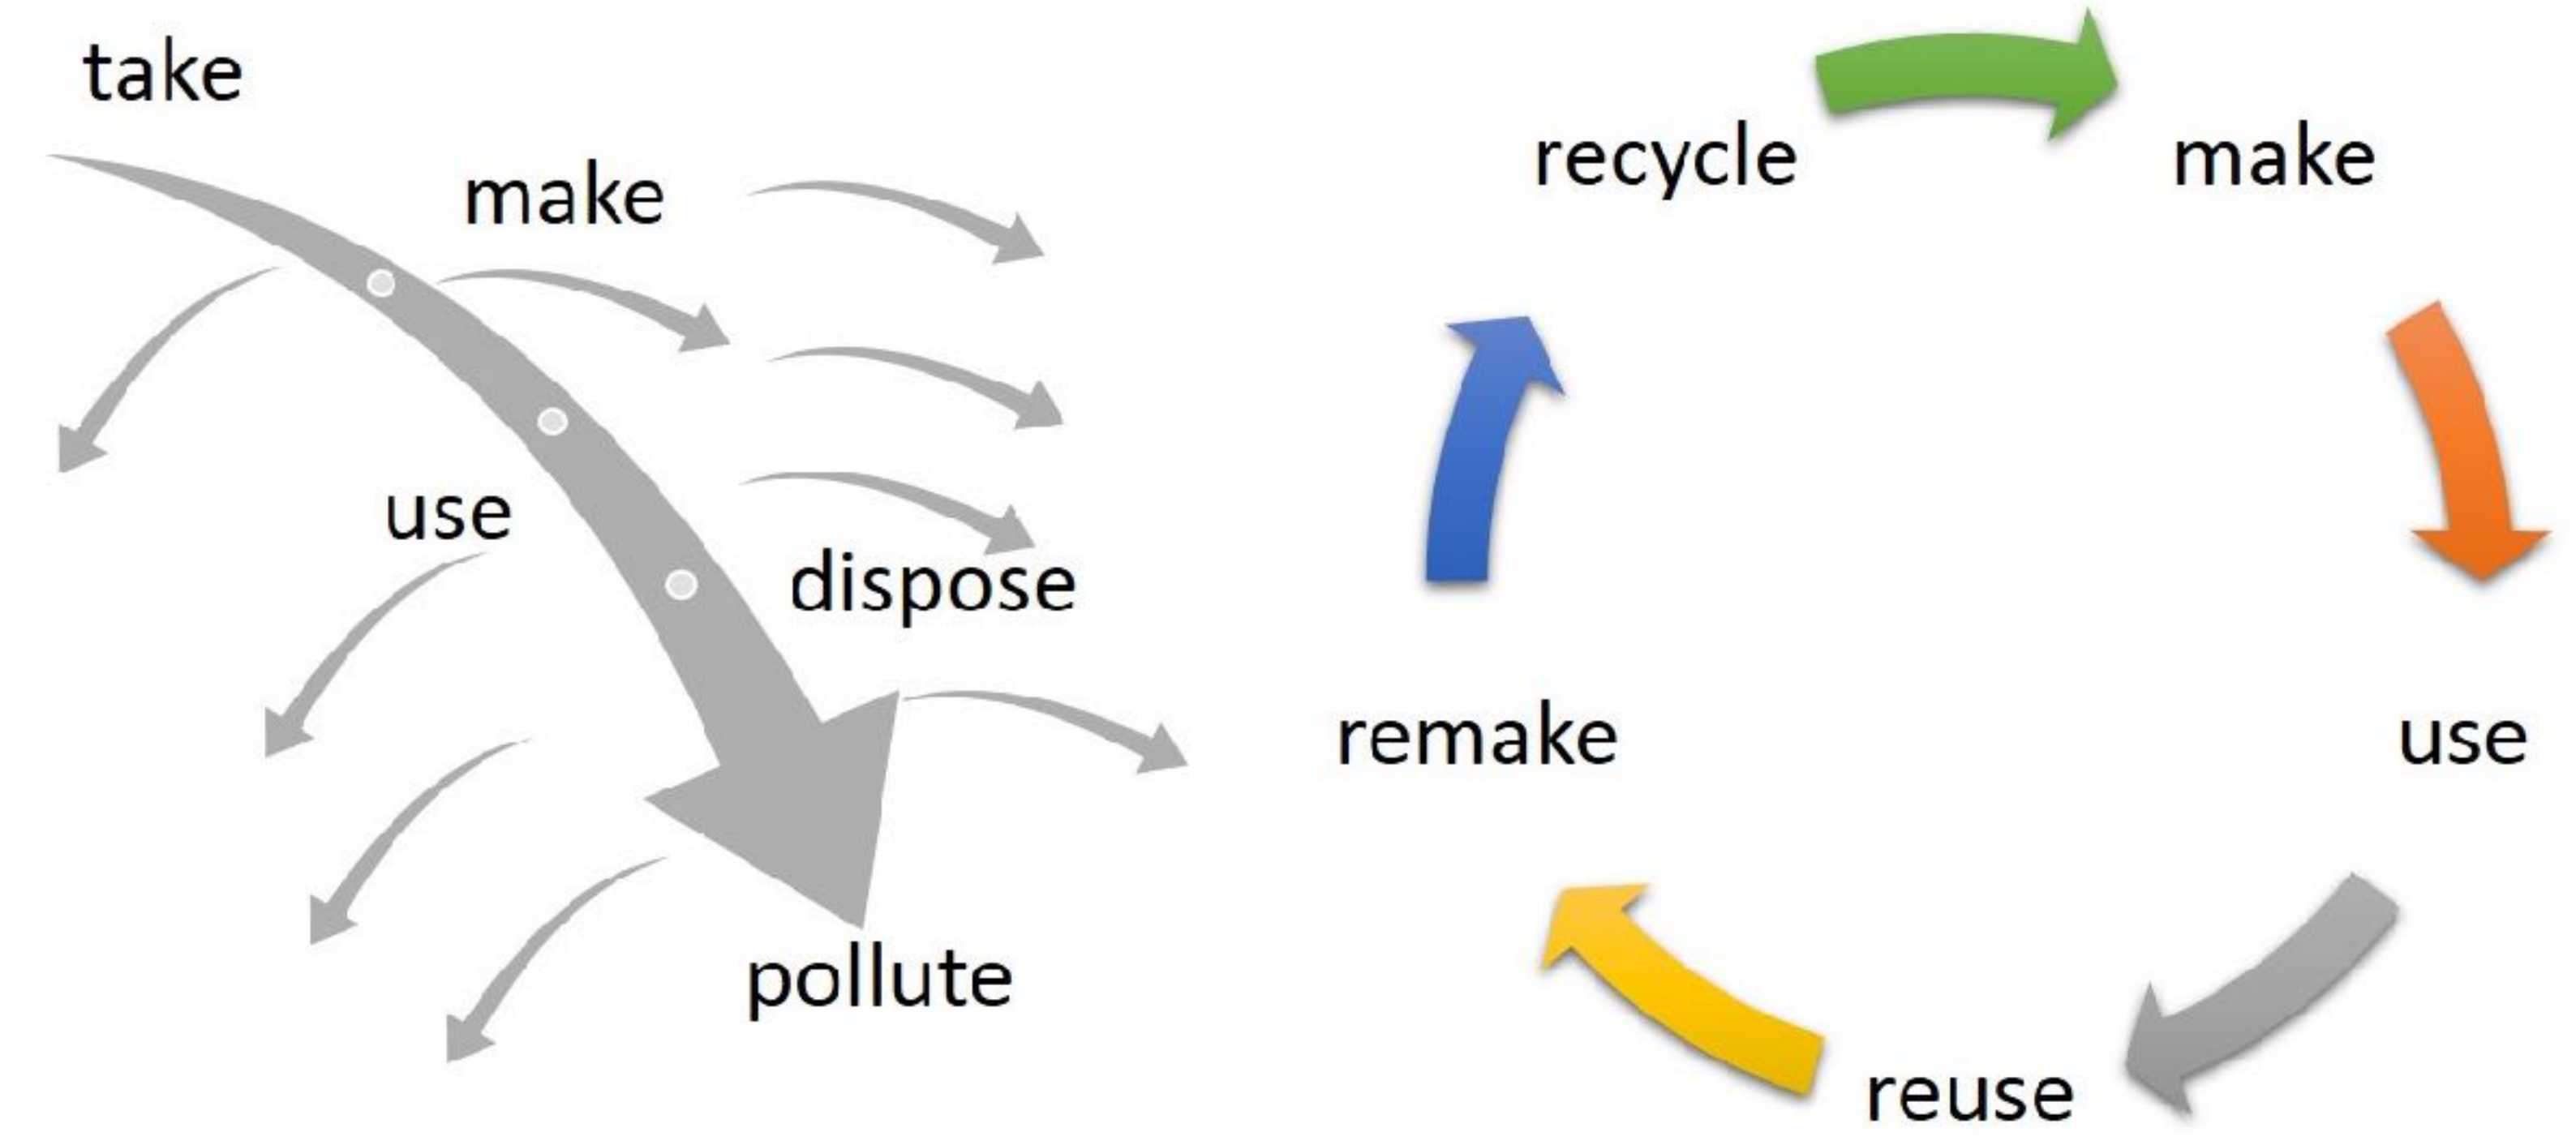

Looking beyond the current take-make-waste extractive industrial model, a circular economy aims to redefine growth, focusing on positive society-wide benefits. It entails gradually decoupling economic activity from the consumption of finite resources, and designing waste out of the system. Underpinned by a transition to renewable energy sources, the circular model builds economic, natural, and social capital. It is based on three principles:

- Design out waste and pollution
- Keep products and materials in use
- Regenerate natural systems

The Therapy: Changing the Official Purpose of Economy

A circular economy seeks to rebuild capital, whether this is financial, manufactured, human, social or natural. This ensures enhanced flows of goods and services. The system diagram illustrates the continuous flow of technical and biological materials through the 'value circle'.

More Recycling Won't Solve Plastic Pollution

It's a lie that wasteful consumers cause the problem and that changing our individual habits can fix it

Recycling plastic is to saving the Earth what hammering a nail is to halting a falling skyscraper. You struggle to find a place to do it and feel pleased when you succeed. But your effort is wholly inadequate and distracts from the real problem of why the building is collapsing in the first place. The real problem is that single-use plastic—the very idea of producing plastic items like grocery bags, which we use for an average of 12 minutes but can persist in the environment for half a millennium—is an incredibly reckless abuse of technology.

The Therapy: Changing the Official Purpose of Economy

HOW DEGROWTH WILL SAVE THE WORLD

Jason Hickel

Foreword by Kofi Klu and Rupert Read of
EXTINCTION REBELLION

[Donations](#)[Newsletter](#)[degrowth?](#)<https://www.degrowth.info>[Home](#)[Degrowth](#)[Blog](#)[Library](#)[Projects](#)[Conferences](#)[Get involved](#)[About us](#)[English](#)

Essential for degrowth is:

- Striving for a self-determined life in dignity for all. This includes deceleration, time welfare and **conviviality**.
- An economy and a society that sustains the natural basis of life.
- A reduction of production and consumption in the global North and liberation from the one-sided Western paradigm of development. This could allow for a self-determined path of social organization in the global South.
- An extension of **democratic** decision-making to allow for real political participation.
- Social changes and an orientation towards **sufficiency** instead of purely technological changes and improvements in efficiency in order to solve ecological problems. We believe that it has historically been proven that **decoupling** economic growth from resource use is not possible.
- The creation of open, connected and localized economies.

OUR COMMON FUTURE

THE WORLD COMMISSION
ON ENVIRONMENT
AND DEVELOPMENT

- Purpose of economy is to increase human wealth;
- Earth and its natural wealth is basically infinite.

Smith (1776)

"Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs".

WCED (1987)

- Smith (1776)*

"Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs".

WCED (1987)

"Sustainable Development is a development that meets the needs of the present while safeguarding Earth's life support systems, on which the welfare of current and future generations depends."

Griggs et al. (2013)

Sustainable development goals for people and planet

Planetary stability must be integrated with United Nations targets to fight poverty and secure human well-being, argue **David Griggs** and colleagues.

The United Nations Rio+20 summit in Brazil in 2012 committed governments to create a set of sustainable development goals (SDGs) that would be integrated into the follow-up to the Millennium Development Goals (MDGs) after their 2015 deadline. Discussions on how to formulate these continue this week at UN headquarters in New York.

We argue that the protection of Earth's

life-support system and poverty reduction must be the twin priorities for SDGs. It is not enough simply to extend MDGs, as some are suggesting, because humans are transforming the planet in ways that could undermine development gains.

As mounting research shows, the stable functioning of Earth systems — including the atmosphere, oceans, forests, waterways, biodiversity and biogeochemical cycles — is

a prerequisite for a thriving global society. With the human population set to rise to 9 billion by 2050, definitions of sustainable development must be revised to include the security of people and the planet.

Defining a unified set of SDGs is challenging, especially when there can be conflict between individual goals, such as energy provision and climate-change prevention. But we show here that it is possible. By ▶

Global Order: The “Global Ruling Class”

The study of futures, and the analysis of power

Bernd Hamm

[Show more](#)

<https://doi.org/10.1016/j.futures.2010.08.017> [Get rights and content](#)

Abstract

This study attempts to find out in which direction global power distribution is shifting. This is expected to shed light on the chances we have to build a democratic, ecologically sustainable and socially just world future society. The paper raises and explores, to some extent, three questions: (1) Who is the emerging global ruling class, and does it develop some sort of class consciousness? (2) What are the means used by the global ruling class in the class struggle? and (3) What are likely consequences for the future of global society?

Power and the Global Ruling Class. Who Rules the World?

The End of Democracy as We Know It

This paper starts with summarizing the major theoretical elements in the definition of a global ruling class. It then examines how neoconservatives in the US took power and used regime change to create chaos in other regions. A strategy of tension is used to press the population into conformity. But the real revolution is to what extent factual politics escape any attempt to democratic control. Three case studies show how far the Deep State already goes. Democracy is on the brink of survival.

Key Points

Purpose of Economy

The *de facto* purpose of economy is to meet the needs of the present while safeguarding the Earth's life-support system, on which the welfare of all current and future generation depends.

The current “official” purpose of economy is to create human wealth; this official purpose is in conflict with the *de facto* purpose.

Syndrome of Modern Global Change

The Holocene was a “safe operating space for humanity” allowing the emergence of a dominant species

During the last few hundred years, humanity has made large and rapid planetary changes, accelerated existing and introduced new flows in the planetary physiology.

The system is outside the “normal range” and in the dynamic transition into the Post-Holocene.

Diagnosis

Making the creation of human wealth the “official” purpose of economy and economic growth the overarching goal turned humans into the “Anthropogenic Cataclysmic Virus” (ACV) in the Earth's life-support system.

Easy access to seemingly unlimited energy allowed humans to accelerate flows in the Earth's life-support system and sustain rapid population growth and increasing demands.

Prognosis

The planet is heading rapidly towards tipping points and a very different system state.

The growth-focused economy is the root cause of the global challenges and poses an existential risk.

Therapy

Aligning the official purpose of economy to the *de facto* purpose: Meeting the need of the present while safeguarding the Earth's life-support system on which the welfare of all current and future generations depends

A new global order and governance that can handle the coming social, economic, and environmental challenges ...
